Phase 1: Source Collection & Pooling

Existing Datasets & Benchmarks

Foundational

Classic domain benchmarks
e.g., TAT-QA, LawBench

Agentic / Open-ended

Reasoning, tools & interaction
e.g., GAIA, ClawBench

Complex Human-evaluated

Strategic, high-difficulty tasks
e.g., OMBench

Collect task instances from all selected sources

Raw Candidate Pool

~30,000 tasks
aggregated from multiple sources

Domain Coverage

Finance | Law | Healthcare | Math | Office

Phase 2: Skill-Chain Curation

Raw pool → ordered, transfer-rich task streams

1. **Skill Labeling & Filtering**
   Identify required skills
   Filter relevance · Rate difficulty
2. **Pairwise Transfer Assessment**
   Can skills from task i support task j?
3. **Dependency Graph & Ordering**
   Difficulty-constrained graph ordering
4. **Human Review**
   Quality, progression & transfer plausibility

5 Ordered Task Streams

100 related tasks per domain

Phase 3: Continual Evaluation

Related Tasks Arrive Sequentially

Earlier experience can support later tasks

Task 1 foundational → **Task 2** related → ··· → **Task 100** advanced

Within Each Task

Instruction → Execution → Feedback & Reflection

Reflection can update the skill repository

+ Create Skill | ↻ Modify Skill

Updated skills become available from Task t+1

Sequential

Retain context, feedback & evolving skills

Task 1 → 2 → ··· → 100

VS

Independent

Reset context & skills before each task

Same tasks, fresh start

Δ = Sequential - Independent
